Huskies

Made with SimpleNotes

Q: Why do huskies have blue eyes?

A: Huskies typically have blue eyes because they inherit a genetic trait that affects the production of melanin, resulting in a lack of pigmentation in the iris and giving them their distinctive blue gaze. This is due to a recessive gene that is common in Siberian breeds like huskies.

Q: How long do huskies live?

A: Huskies typically live between 12-15 years on average, with some living up to 17 years or more with proper care and nutrition. However, their lifespan can vary depending on factors such as genetics, diet, exercise, and health conditions.

Q: What food do huskies eat?

A: Huskies are carnivores and typically thrive on a diet rich in protein from animal sources, such as high-quality dog foods or cooked meats like chicken, beef, or fish. They may also benefit from occasional treats like eggs, yogurt, or cottage cheese, but it's essential to avoid overfeeding and maintain a balanced diet to keep them healthy and happy.
